HelloID

HelloID is a modern and secure cloud-based Identity & Access Management (IAM) solution.

With one powerful and cost-efficient cloud solution, you have an answer to the increasingly complex Identity Management issues within your organization.

IDENTITY AND ACCESS MANAGEMENT AS A SERVICE

The internal IT has become a driving factor for organizations as it contributes more and more to their success. Tackling the transition from on-premise to cloud forms a challenge. Your IT department already feels this pressure, ever more demanding legislation and regulations regarding auditing and security exacerbate this process.

HelloID assists your organization in improving efficiency and responding to compliance requirements. This complete cloud-based Identity Management solution offers your employees a modern, user-friendly and secure cloud desktop for all their IT applications - all with considerably low investment and minimal management costs.

ACCESS MANAGEMENT

HelloID Access Management offers employees, partners and even customers uniform and straightforward access to your cloud applications. Authentication takes place via a single login with username and password. If desired, two-factor authentication can be used as extra verification.

The user gains access to a user-friendly dashboard on the laptop, tablet or smartphone. This dashboard contains all of the applications to which the user has access, recognizable by their icons and opened with one click. The end user only needs to log in once. HelloID supports all common Single Sign-On (SSO) protocols to automatically identify and authenticate users per each cloud application - even if that application does not support any SSO protocols or industry standards.

SELF-SERVICE & WORKFLOW MANAGEMENT

HelloID introduces Self-Service and Service Automation for your IT-department. Users can request access to applications or data via an online portal. Thier manager can approve these requests with a single click, after approval changes are processed automatically in the IT infrastructure.

With HelloID, you can easily publish and manage your internal IT product catalog. With greater insight than ever before at their fingertips, managers keep track of which employees are active and which licenses, apps, shares, etc. they have in use. Changes are handled and registered uniformly without ever passing the helpdesk, decreasing bottlenecks and contributing to a professional and modern look for your IT department and company.

DATA MANAGEMENT

HelloID Data Management modernizes and streamlines access control to your business-critical data. Thanks to HelloID, complicated and error-prone management procedures in the file system and the Active Directory are a thing of the past. No longer are you reliant on the helpdesk for these processes. A project manager, department manager or assistant can independently manage access to folders and subfolders as a data owner. Employees submit access requests directly to the data owner through the online portal.

With HelloID, any data owner can create groups and automatically make the right employees members, create the relevant folders and set Access Control Lists (ACLs). Complete yet flexible and logged end-to-end data management is now possible without burdening the IT department.

IAM IN THE CLOUD

HelloID provides Identity & Access Management (IAM) from the cloud. You do not have to invest in your own infrastructure with hardware, storage, security and Identity Management software. The installation and configuration are literally a matter of hours. Tools4ever provides subsequent maintenance and management, including automatic updates. You only have to take care of organization-specific configuration yourself which is very easy with HelloID. The low costs and minimal maintenance effort arrive with much greater control and safety.

Compared to on-premises options, Identity as a Service (IDaaS) from Tools4ever runs in a highly secure Azure environment, which is also thoroughly checked every six months by Deloitte Risk Services. Compliance with the strict security requirements is therefore ensured.
